

During a telephone conversation with applicants' representative, applicants requested the Examiner's assistance in suggesting language that adequately conveys the intended invention while overcome the prior. The Examiner believes that the language below both describes applicants' invention as well as overcomes the prior art of record. The language follows from the teachings found on pages 12 and 16 to 18 of the instant specification.

The Examiner notes that she has not conducted an updated review of the prior art, as no amendment has been made to the claims at this time; however, this language does distinguish the claims from the Reddy and Wang references cited previously.

The examiner suggests inserting the term "particle" after "polyorganosiloxane" prior to "in a latex state (A)" in claim 1.

The Examiner suggests deleting everything after "becomes 100 parts by weight" (i.e. all of the underlined words added in the claims filed 10/29/10) and inserting the following:

wherein polyorganosiloxane particles in a latex state (A) are prepared by polymerizing siloxane monomers in the presence of a silane grafting agent (E), thereby producing a modified polyorganosiloxane, and said modified polyorganosiloxane is subsequently reacted with a silane grafting agent (F) such that grafting agent (F) is unevenly distributed on the surface of the polyorganosiloxane particles.
